

Photovoltaic panel installation without pressure blocks

Can a non-penetrating solar mounting system be installed without damaging the roof?

With the widespread use of solar energy, more and more people are choosing to install solar photovoltaic systems. Non-penetrating solar mounting systems can be installed without damaging the waterproof layer of the roof. This article will briefly introduce non-penetrating solar mounting systems.

How to install a photovoltaic system?

Photovoltaic system modules can be installed on a building's roof, its facade or on the ground. During the initial survey, the installer will check the feasibility, taking into account: the correct exposure and incline of the surface, which must be facing southwards, southeast or southwest. The incline should be between 10° and 35°;

What is non-penetrating solar mounting?

This mounting system uses gravity and friction to keep the solar modules stable without the use of bolting as in traditional mounting methods. Non-penetrating solar mounting has the following advantages: 1.

What are the advantages of non-penetrating solar mounting?

Non-penetrating solar mounting has the following advantages: 1. Protection of roof waterproofing: Non-penetrating mounting systems avoid the risk of penetrating the roof waterproofing during solar installation. This is an important advantage because damage to the waterproofing layer can lead to roof leaks and increased repair costs. 2.
