

Solar and off-grid solar system

What is the difference between on-grid and off-grid solar?

Explaining both in a simple way: these terms describe whether your solar system is connected to the local utility grid. On-grid solar systems connect directly to the grid, allowing you to use grid power when your panels are not producing enough energy and sometimes even sell excess electricity back. Off-grid solar systems function independently.

What is an off-grid Solar System?

An off grid solar system is a standalone power generation setup that operates independently from the electrical grid. Unlike grid-tied systems that can sell excess power back to utilities, off-grid systems store all generated electricity in batteries for use when the sun isn't shining. The system consists of four main components working together:

What is the difference between off-grid solar and hybrid solar?

Off-grid solar systems require specialised off-grid inverters and battery systems large enough to store energy for 2 or more days. Hybrid grid-connected systems use lower-cost hybrid (battery) inverters and only require a battery large enough to supply energy for 5 to 10 hours (overnight), depending on the application.

Are on-grid solar systems a good choice?

Future expansion: On-grid systems are typically easier to scale. Hybrid systems are also an option, combining the benefits of both on-grid and off-grid solar systems with batteries and grid access. Both on-grid and off-grid systems are effective solutions. The choice depends on what you value most.
