

Wide-temperature-range data center cabinets for tunnels

Why do you need a telecommunications cabinet?

Our vast selection of cabinets, thermal management, racks, enclosures for data centers, telecommunications equipment rooms, and enterprise cabling applications help optimize space, reduce energy consumption, and enhance network reliability.

How long do data centers last?

Data centers replace their IT equipment much faster than the infrastructure hosting them. For example, a cabinet is, on average, used for 15-20 years, while servers have a typical lifespan of only 3 to 5 years.

What temperature should a data center be?

ASHRAE issued its first thermal guidelines for data centers in 2004. The original ASHRAE temperature recommended envelope for data centers was 20-25°C (68-77°F). This was a conservative statement, based on data available at the time, on where a data center could be reliably operated.

Why should a data center monitor air temperature?

Temperatures can vary widely across a data center even within the length of a meter. Real-time monitoring and reporting of air temperature will prevent accidental equipment overheating and it is a tool the data center operator can use to optimize cooling.
